

CHEMICAL RESISTANCE FOR NAN YA CALENDER SHEET FILM

One of the most important properties of compound based on PVC is their exceptional chemical resistance. Presence of a large amount of Chlorine in the polymer composition is the main reason for it. Rigid PVC compounds offer excellent resistance to a broad range of reagents and mixture that smell, dissolve, or corrode many other materials.

Plasticized PVC usually have poor chemical resistance caused by extraction of the plasticizer, however, PVC compounds plasticized with polymeric plasticizer or nitrile rubbers have much better chemical and extraction resistance. If you are searching for these kind of material, please contact Technical Dept. for price and specification.

However, PVC is not recommended for use with chlorinated or aromatic hydrocarbons, esters, ketones, and certain organic solvent such as tetrahydrofuran.

The following chemical resistance is done by Nan Ya Plastics Corp. and related engineer, please take these as reference for your material purchasing.

A+ : RESISTANCE
A : PRACTICAL RESISTANCE
B+ : LIMITED RESISTANCE
B : WEAK RESISTANCE
C : NO RESISTANCE
R : RECOMMENDED
NR : NOT RECOMMENDED
